

# External Resources

Free material for extension and catch-up

Everything here is free. The point of this file is that you should not be writing curriculum from scratch when hundreds of hours of tested material already exist — use these for extension work, for catch-up, for fast finishers, and as the backbone if you ever need a substitute volunteer to run a session cold.

## The core platform

- [Scratch](#) — the editor, in a browser
- [Scratch Desktop](#) — the offline editor. Carry the installers on a USB stick and offer to install it in week one; the laptops are the families' own
- [Scratch for Educators](#) — teacher accounts, class management, and their own teaching guides
- [Scratch Teacher Accounts Guide \(PDF\)](#)

## Project libraries – the ones to actually use

### Raspberry Pi Foundation project pathways

The best free structured Scratch material there is. Each project is a self-contained step-by-step guide a child can follow independently, which makes them perfect for fast finishers and absent students.

- [Introduction to Scratch](#) — sprites, scripts and loops. Roughly weeks 1–3 of this course. Projects: Space talk, Catch the bus, Find the bug, Silly eyes, Surprise! animation, I made you a book
- [More Scratch](#) — broadcast, decisions and variables. Roughly weeks 4–6. Projects: Broadcasting spells, Grow a dragonfly, Drum star, Next customer please, Don't fall in!, This sprite needs you
- [Further Scratch](#) — clones, My Blocks and boolean logic. Beyond this course. Where to send anyone racing ahead

"Don't fall in!" in the More Scratch path is the closest thing to Sky Catcher and is a natural follow-on project for the holidays.

### Code Club Aotearoa

- [Code Club Aotearoa](#) — the New Zealand Code Club network. Free projects, volunteer-run clubs, local support
- [All Code Club projects](#) — the full library
- [Starting a Code Club](#) — worth reading even if you stay independent, and worth considering joining
- They also host **Digital Pūkai** projects with an Aotearoa context (Kōhiti Watch, My Kupu App, Move the Hoiho) and the **Moonhack** projects (Matariki, Satellites in Space) — good one-off sessions if you ever need to fill a week

### Others worth knowing

- [Harvard Creative Computing Curriculum](#) — the original Scratch curriculum guide. More theory than you need for eight weeks, but excellent on *why* the pedagogy works the way it does

- [Google CS First](#) — themed Scratch project packs with videos. Good if you want a session that runs itself
- [ScratchEd](#) — a community of Scratch educators. Useful when you hit a teaching problem someone has definitely already solved

## For volunteers who want to understand the teaching better

---

- The **Raspberry Pi Foundation's mentor notes** attached to each pathway — click "Mentor information" on any pathway page. Short, practical, written for exactly your situation
- **Semantic waves** and **PRIMM** are the two teaching frameworks worth twenty minutes of reading if you're enjoying this and want to get better at it. Both are about moving between concrete and abstract, which is precisely what the class rhythm here does: big idea, throwaway activity, then back into the game.

## Where students go next

---

Put these on the week-eight keep-going sheet:

1. [More Scratch](#) if they haven't done it — the direct next step
2. [Further Scratch](#) for the ones who found this easy
3. **The club studio** — seeing and remixing each other's work is more motivating than any official project
4. **The Python track**, next term, for anyone 12 or over who's ready for text

## A note on licensing

---

Raspberry Pi Foundation and Code Club materials are free to use but have their own licence terms. Check them before reprinting or republishing their content — linking to them, which is what this pack does, is always fine.

Everything in this pack is yours to adapt, share, and rewrite.
